## Planning your project

**Direction:** Discuss the following:

### 1. Background of your project

The business focuses on offering management into an organization or a company. With its implementation, the beneficiary can experience a high quality of management and can move around accompanied by a secured environment. It offers different managing functions that can be helpful on an everyday basis such as, printing some documents, editing a profile, building accessibility in a hierarchical order, and etc.

### 2. Objective

The main objective of the application is to give a more efficient and organized way of managing an organization by implementing the application with its secured capabilities. As a business that has started out recently, we offer anything that you need in order to facilitate an organization or a company. It is purposely developed to aid an organization wherein they are experiencing any kind of difficulty in their environment or workplace.

### 3. Expected output

The existing application functions in accordance with the said goals. With that, we would also like to insert additional features such as To Do or Notes implementation in order for an individual to track their process neatly and efficiently. To broaden the exporting features of the application, not just PDF but to be able to export different extensions whenever they need it. Upon reaching our desired output, we will implement the application by using the Azure server to be able to maximize its capabilities as a static web page application.

### 4. Plan on system administration, maintenance and deployment

As one of our alternatives for maintenance, we'll try to have a server backup the complete system's database, including older versions and upcoming updates.

Now that the application is built with different roles. As a plan for system administration, we would be maximizing its capabilities by assigning and controlling the roles for a specific individual in the organization.
